

## **GENERAL CARE OF YOUR DOG**

### **Brushing Your Dog**

Brushing your dog not only removes dirt, grease and dead hair from her coat, but it helps to remove skin flakes and stimulates blood circulation, improving the overall condition of her skin. One or two brushings per week will help kitty to keep her healthy glow—and you'll find that regular sessions are especially beneficial when your dog ages and is no longer able to groom so meticulously on her own.

- Before brushing, check out the condition of your kitty's coat. If it's healthy, her hair will have a natural gloss and spring back under your hand when you touch it. There shouldn't be any bald patches or signs of fleas and ticks, and her skin should be free of wounds and unusual bumps.
- For short-haired dogs: With a metal comb, work the brush through your dog's fur from head to tail to remove dirt and debris. Work along the lie of her fur, brushing in the direction the coat grows. Brush all over her body, including her chest and abdomen, concentrating on one section at a time to remove dead hair and tangles. A rubber brush can be especially effective for removing dead hair on dogs with short fur.
- For long-haired dogs: Long-haired dogs who live indoors shed throughout the year and need grooming sessions every few days to remove dead hair and prevent tangles. Start with her abdomen and legs, gently combing the fur upward toward her head. Comb the neck fur upward, toward her chin. Make a part down the middle of her tail and gently brush out the fur on either side. You can sprinkle talcum powder over knots and gently use your fingers to tease them apart. If the knots don't come out by hand, try using a mat-splitter.
- During your weekly grooming sessions, run your hands along your dog's body, checking for wounds, bumps and hidden tangles. Check for ticks and flea dirt, black specks of dried blood left behind by fleas. Sneak a peek under her tail to check for feces attached to the fur that may need to be snipped away with scissors. It's also important to check around your dog's anus for tan, rice-sized objects—these may indicate the presence of tapeworm.
- Neglecting to brush your kitty's coat can lead to painful tangles and a bellyful of hair. You'll know if your dog is suffering from hairballs when he coughs them up onto the floor or expels them in his feces. If, despite regular brushing, your dog continues to suffer from hairballs, there are several remedies available. Please ask your vet to recommend a solution.

## Skin Problems

The condition of your dog's skin is an indication of her overall health. When a skin problem occurs, your dog may respond with excessive scratching, chewing and/or licking. A wide range of causes—from external parasites and allergies to seasonal changes and stress, or a combination of these—may be affecting your dog's skin and should be investigated. Skin problems are one of the most common reasons pet parents seek veterinary care.

### Symptoms of Skin Problems in Dogs

Constant scratching, licking and chewing at the skin, especially around the head and neck, Scabs, Redness or inflammation, Round, scaly patches on the face and paws, Dry, flaky or otherwise irritated skin, Hair loss, bald patches, Hairballs, Rashes, Swellings, lumps or skin discoloration, Drainage of blood or pus

One of the following may be causing an abnormality with your dog's skin and should be investigated:

- Ringworm: This highly contagious fungal infection can result in inflammation, scaly patches and hair loss. Lesions are most commonly seen on the head, ears and paws, but sometimes no signs are seen. You'll want to have your veterinarian treat it immediately to prevent other pets and people in the household from becoming infected.
- Fleas: Not only do fleas irritate the skin, dogs can have an allergic response when exposed to them. Symptoms commonly include excessive scratching, thinning of hair above the base of the tail, crusts and red, raised skin lesions. Some dogs may also be sensitive to flea-treatment products; certain flea collars, for example, may cause redness and irritation around the neck.
- Other external parasites: Ear mites usually cause itching and redness around the ears and a dark, coffee ground-like material can be seen in the ear canals. Lice can produce intense itching, and mange mites can cause severe flaking and scaling.
- Seasonal allergies: Your dog's constant scratching may be due to her sensitivity to common allergens from trees, mold and grasses.
- Food allergies: Many foods (such as beef, milk, poultry and corn), fillers and colorings can be seen as foreign by your dog's immune system and can lead to itching and rashes.

- Grooming products: Certain shampoos and grooming products can irritate your dog's skin.
- Seasonal changes: Many dogs, like people, get dry, flaky skin in the winter.
- Environmental factors: Contact with certain chemicals or fabrics can cause skin irritation, as can exposure to the sun or excessive cold.
- Bacterial or yeast infections: These infections most commonly follow the onset of another skin disorder.
- Tumors: A variety of benign and malignant skin growths can develop in dogs.
- Stress: Anxiety may cause dogs to excessively lick and chew, causing hair loss.

You should visit your vet for an exam as soon as you notice any abnormality in your pet's skin, such as excessive hair loss, flaking and scaling, redness and bald patches, or if your pet begins to excessively scratch, lick and/or bite areas on his fur.

After obtaining a history and performing a thorough physical examination of your dog, your vet may perform some of the following diagnostic tests in order to find the cause of your dog's symptoms:

- Skin scraping with findings evaluated under a microscope to check for mites
- "Tape test" to check for parasites
- Individual hair examination under a microscope
- Bacterial culture and sensitivity tests
- Skin biopsy
- Food and other allergy testing
- Blood tests to assess your dog's overall health
- Microscopic evaluation of cells to establish if bacteria or yeast are present

### Which Dogs Are Prone to Skin Problems?

Because of the wide ranges of causes, dogs of all ages and breeds are susceptible to issues involving skin. Young, elderly, immunocompromised and dogs living in overcrowded, stressful environments may be more susceptible to skin problems than others.

### To Prevent Skin Problems

- Use natural, hypoallergenic soaps and shampoos recommended for use on dogs. Brush your dog regularly to prevent matting of hair. Feed your dog a healthy, balanced food without fillers or artificial ingredients. Implement a flea-treatment program recommended by your veterinarian. Thoroughly clean and vacuum your home (and remember to always throw away the bag). Provide calm living conditions for your dog. Your vet may prescribe skin creams and/or oral medications to prevent skin problems.

## To Treat Skin Problems

Ask your vet about the following treatments:

- Topical products, including shampoos, dips and sprays, to prevent and treat parasites
- A balanced diet to help maintain healthy skin and coat
- Antibiotic or antifungal medications
- A dietary supplement containing essential fatty acids
- Corticosteroids and antihistamines may be prescribed to control itching.
- Hypoallergenic diet for food allergies

## Shedding

Shedding is a dog's natural process of losing dead hair. Indoor dogs can shed all year-round. Regularly grooming your dog and vacuuming hair from your house should minimize the inconvenience of shedding. However, if you see bald patches in your dog's fur or notice a significant loss of hair, the underlying cause may be a health-related problem and should be investigated by a veterinarian.

A variety of medical, dietary and stress-related issues can cause your dog to lose more hair than is normal. If you notice he's losing an excessive amount of hair or has bald patches, please consult your veterinarian immediately. Your dog may be suffering from one of the following health issues:

- Allergies, Ringworm, Bacterial infection, Fleas, Hormonal imbalance such as hyperthyroidism, Poor diet, Stress, Certain medications, Pregnancy or lactation, Sunburn

If your dog obsessively licks, bites or scratches, OR if he's losing patches of hair or stops to scratch or bite the same few spots persistently, then it's important you take

him in for a veterinary exam. There may be a medical, dietary or stress-related issue that needs immediate attention.

If your dog sheds a lot and your veterinarian has determined that there is no underlying medical cause, there are a few things you can do to minimize his hair loss:

- Feed him a healthy, balanced diet.
- Groom him regularly.
- Examine your dog's skin and coat during your grooming sessions. Checking for hair loss, redness, bumps, cuts, fleas, ticks or other parasites will be a fast way to determine whether you need to go the vet to solve your pet's shedding.

If your dog's shedding is normal, the worst you may end up with is a hairy wardrobe and home—your dog, however, may suffer from hairballs if she isn't groomed regularly. If her shedding is due to an underlying medical cause, including allergies, parasites, infections or disease, her health may continue to worsen if you don't seek veterinary care. Additionally, dogs who are not groomed appropriately can become matted—this is especially true for long-haired dogs. Matted hair can be painful and lead to underlying skin problems.

### Ear Care

Your dog's ears may be able to pick up the sound of a bag of treats being opened across the house, but they could still use a little help staying clean. Monitoring your kitty's ears once per week for wax, debris and infection will help those sensitive sonar detectors stay perky and alert to your every move.

### Outer Ear Check

A healthy feline ear flap, or pinna, has a layer of hair on its outer surface with no bald spots, and its inner surface is clean and light pink. If you see any discharge, redness or swelling, your dog's ears should be checked by a veterinarian.

### Inner Ear Exam

Bring kitty into a quiet room where there are no other pets. Gently fold back each ear and look down into the canal. Healthy inner ears will be pale pink in color, carry no debris or odor and will have minimal if no earwax. If you find that your dog's ears are caked with wax or you detect an odor, please bring her in for a veterinary exam.

## Ear Cleaning 101

1. Place a little bit of liquid ear cleaner (ask your vet for a recommendation) onto a clean cotton ball or piece of gauze. Do NOT go by “what your neighbor” suggests!!!!
2. Fold kitty’s ear back gently and wipe away any debris or earwax that you can see on the underside of her ear.
3. Lift away the dirt and wax rather than rubbing it into the ear. And do not attempt to clean the canal—probing inside of your dog’s ear can cause trauma or infection.

## Signs of Ear Problems

Watch for the following signs that may indicate your dog’s ears should be checked by a veterinarian.

- Persistent scratching and pawing of the ear area, Sensitivity to touch, Head tilting or shaking, Loss of balance and disorientation, Redness or swelling of the ear flap or canal, Unpleasant odor, Black or yellowish discharge, Accumulation of dark brown wax, Hearing loss, Bleeding

## Know Your Ear Disorders

- Ear mites are common parasites that are highly contagious among pets. Telltale signs include excessive itching of the ears and debris that resembles coffee grounds.
- Ear infections are usually caused by bacteria, yeast or foreign debris caught in the ear canal. Treatment should be sought immediately as ear infections can cause considerable discomfort and may indicate allergies, hormonal abnormalities or hereditary disease.
- Blood blisters (hematoma) are the result of blood accumulation in the ear flap. They’re often caused by infection, ear mites, fleas or trapped debris that causes your dog to scratch her ears or shake her head excessively.

## Healthy Paws

Dogs need healthy feet to scratch, climb and achieve their famed acrobatic landings. That’s why it’s important to regularly examine and clean your dog’s paws and make sure they’re wound-free.

- Your dog's feet should always be kept clean. Aside from causing pain, unhealthy substances that stick to her feet may end up on her tongue during grooming. Once each day, give your dog's paws a gentle wipe with a damp cloth, checking between her toes and around the paw pads. Keeping your floors and other surfaces free of debris and household chemicals will go a long way to help keep your dog's feet clean.
- Dogs are natural explorers who sometimes get into foreign places. Check your dog's paws regularly for any cuts, sores, splinters or swellings. Remove splinters or debris gently with tweezers and clean any small cuts. If you notice any blood, pus or an unusual odor, please take your dog to the vet to check for infection.
- Long-haired kitties may have hair sprouting in between their toes. If this irritates your dog (you'll know if she licks at the hair obsessively), trim them gently with a small pair of rounded scissors.
- Be wary of your kitty's sensitive paw pads. In hot and cold weather, moisturize them with a vet-recommended product and try to avoid letting your dog's feet touch freezing patios, hot sidewalks or other uncomfortable surfaces.
- If you notice your dog obsessively cleaning her paws, limping or favoring one leg, please investigate—she might require veterinary attention.

## Nail Care

Does your kitty disappear when the clippers come out? Do you have to wrap her in a towel to give her a manicure? Follow these steps to help your dog relax while you trim.

1. Choose a chair in a quiet room where you can comfortably sit your dog on your lap. Get her when she's relaxed and even sleepy, such as in her groggy, after-meal state. Take care that she isn't able to spy any birds, wild animals or action outside nearby windows—and make sure no other pets are around.
2. Gently take one of your dog's paws between your fingers and massage for no longer than three seconds. If your dog pulls her paw away, don't squeeze or pinch, just follow her gesture, keeping in gentle contact. When she's still again, give her pad a little press so that the nail extends out, then release her paw and immediately give her a treat. Do this every other day on a different toe until you've gotten to know all ten.
3. Your dog should be at ease with the sound of the clippers before you attempt to trim her nails. Sit her on your lap, put a piece of uncooked spaghetti into the clippers and hold them near your dog. (If she sniffs the clippers, set a treat on top of them for her to eat.) Next, while massaging one of your dog's toes, gently press her toe pad. When the nail extends, clip the spaghetti with the

clippers while still holding your dog's paw gently. Now release her toe and quickly give her a treat.

4. The pink part of a dog's nail, called the quick, is where the nerves and blood vessels are. Do NOT cut this sensitive area. Snip only the white part of the claw. It's better to be cautious and cut less of the nail rather than risk cutting this area. If you do accidentally cut the quick, any bleeding can be stopped with a styptic powder or stick. It's a good idea to keep it nearby while you trim.
5. With your dog in your lap facing away from you, take one of her toes in your hand, massage and press the pad until the nail extends. Now trim only the sharp tip of one nail, release your dog's toe and quickly give her a treat. If your dog didn't notice, clip another nail, but don't trim more than two claws in one sitting until your dog is comfortable. Then, reward her with a special treat.
6. A nail-trimming every ten days to two weeks is recommended. If your dog refuses to let you clip her claws, ask your vet or a groomer for help.
7. If your dog resists, don't raise your voice or punish her. Never attempt a clipping when your dog is agitated or you're upset. And don't rush—you may cut into the quick.
8. Don't try to trim all of your dog's claws at one time.
9. Do NOT declaw your dog. This surgery involves amputating the end of a dog's toes and is highly discouraged by the ASPCA. Instead, trim regularly, provide your dog with appropriate scratching posts and ask your veterinarian about soft plastic covers for your dog's claws.

## Dental Care

Your dog needs clean, sharp teeth and healthy gums. Damage to the tongue, teeth, palate and gums can lead to many health risks for felines, but these can be prevented with regular home check-ups and good old-fashioned brushings.

- If your kitty's mouth has an abnormally strong odor, he may have digestive problems or a gum condition such as gingivitis, and should be examined by a vet.
- With your dog facing you, gently push back his lips and take a look. The gums should be firm and pink, not white or red, and should show no signs of swelling. The teeth should be clean and free of any brownish tartar, and none should be loose or broken.
- Watch for any of the following signs that could indicate problems in your dog's mouth:

- Dark red line along the gums, Red and swollen gums, Ulcers on gums or tongue, Loose teeth, Pus, Difficulty chewing food, Excessive drooling, Excessive pawing at the mouth area
- At any sign of gum inflammation, you should take your dog in for a veterinary exam. If left untreated, gum disease can develop, possibly leading to tooth loss or inability to eat. Inflammation may also point to an internal problem like kidney disease or Feline Immunodeficiency Virus.
- Bacteria and plaque-forming foods can cause a buildup on a dog's teeth. This can harden into tartar, possibly causing gingivitis, receding gums and tooth loss.
- All you'll need to brush your dog's teeth are cotton swabs and a small toothbrush and tube of toothpaste formulated for felines. You can also use salt and water. Ask your vet to suggest the brushing supplies that he trusts, and be sure never to use toothpaste designed for people—the ingredients can be unhealthy for your dog.

Brush your dog's teeth at home by following these simple steps:

1. First get your dog used to the idea of having her teeth brushed. Start by gently massaging her gums with your fingers or touching a cotton swab to them.
2. After a few sessions, put a little bit of dog-formulated toothpaste on her lips to get her used to the taste.
3. Introduce a toothbrush designed especially for dogs—it will be smaller than human toothbrushes and have softer bristles. Toothbrushes that you can wear over your finger are also available and allow you to give a nice massage to your dog's gums.
4. Apply the toothpaste to her teeth for a gentle brushing.

Chew toys can satisfy your dog's natural desire to chomp, while making her teeth strong. Gnawing on a chew toy can also help floss your dog's teeth, massage her gums and scrape away soft tartar.

If your dog suffers from any of the symptoms mentioned below, please see the vet right away:

- **Gingivitis:** This inflammation of the gums is mainly seen in older dogs. It may start as a dark red line bordering on the teeth. If left untreated, gums may become sore and ulceration may occur. This may be a sign of FIV or other infection.

- Periodontitis: If gingivitis invades the tooth socket, the tooth may become loose and an abscess may form.
- Stomatitis: This inflammation of the mouth lining may result from a foreign body in the mouth, a viral disease or dental problems. The dog will have difficulty eating and the inside of the mouth will appear red.
- Rodent Ulcer: A slowly enlarging sore or swelling on the upper lip.
- Salivary Cyst: If salivary glands or ducts that carry saliva to the mouth become blocked, a cyst may form under the tongue.
- Mouth Ulcers: Ulcers on a dog's tongue and gums are sometimes caused by feline respiratory or kidney disease.

## Eye Care

A good home eye exam just before grooming can clue you into any tearing, crust, cloudiness or inflammation that may indicate a health problem. Here are few simple tips to keep your kitty's eyes bright and healthy.

- Face your dog in a brightly lit area and look her in the eyes. They should be clear and bright, and the area around the eyeball should be white. Her pupils should be equal in size.
- Roll down your kitty's eyelid gently with your thumb and take a look at the lid's lining. It should be pink, not red or white.
- Wipe away any crusty gunk from your dog's eyes with a damp cotton ball. Always wipe away from the corner of the eye, and use a fresh cotton ball for each eye. Snip away any long hairs that could be blocking her vision or poking her eyes. Try not to use eye washes or eye drops unless they've been prescribed by your vet.

How can you tell if there is something wrong with one or both of your dog's eyes?

Look out for the following:

- Discharge, Watering, Red or white eyelid linings, Crusty gunk in the corners of the eye, Tear-stained fur, Closed eye(s), Cloudiness or change in eye color, Visible third eyelid

Certain body language will also alert you to possible eye distress. If your dog is constantly squinting or pawing at her eye area, give her eyes a good inspection. If you find any of the above symptoms, you should immediately call your vet.

The following eye-related disorders are commonly seen in dogs:

- Conjunctivitis: One or both of your dog's eyes will look red and swollen, and there may be discharge.
- Third eyelid protrusion: If the third eyelid becomes visible or crosses your dog's eye, he may have a wound or may be suffering from diarrhea, worms or a virus.
- Keratitis: If your dog's cornea becomes inflamed, the eye will look cloudy and watery.
- Dogaracts: This opacity on the eye is often seen in elderly and diabetic dogs.
- Glaucoma: The cornea becomes cloudy and the eye enlarges due to an increased pressure in the eyeball.
- Bulging eye: Bulging can occur because of accident or trauma or an eye tumor.
- Retinal disease: Partial or total vision loss can happen when light-sensitive cells at the back of the eye degenerate.
- Watery eyes: The fur around your dog's eyes may be stained with tears because of blocked tear ducts or an overproduction of tears.

Many feline eye disorders can be treated with vet-prescribed drops or ointments—your vet will show you how to apply eye and ear drops at home.

The best way to prevent eye conditions is to make sure your dog gets all her vaccinations and has thorough check-ups. Please examine her eyes regularly and consult a vet if you find any abnormalities. Eye conditions that are left untreated can lead to impaired sight or even blindness.

PLEASE contact your vet if you have any questions!!!
